#### **PLATYHELMINTHES** *FLATWORMS*

#### **PLATYHELMINTHES** *FLATWORMS*

Phylogenetic Tree of KINGDOM ANIMALIA

## WHAT IS A FLATWORM?

•What Is a Flatworm?

- Flatworms are <u>soft</u>, <u>flattened</u> <u>worms</u> that have <u>tissues</u> and <u>internal</u> <u>organ</u> systems.
- They are the simplest animals to have
  - <u>three</u> embryonic <u>germ</u> <u>layers</u> (aka: <u>triploblastic</u>)
    - Ectoderm, mesoderm, endoderm
  - bilateral symmetry
  - <u>cephalization</u>.

## THE THREE GERM LAYERS

## BILATERAL SYMMETRY

### CEPHALIZATION

## SURFACES

## WHAT IS A FLATWORM?

- Flatworms are <u>acoelomates</u>, which means they have no <u>coelom</u>.
- A coelom is a fluid-filled body cavity that is lined with tissue derived from <u>mesoderm</u>.
- The <u>digestive</u> <u>cavity</u> is the only body cavity in a flatworm.

### FORM AND FUNCTION IN FLATWORMS

- Form and Function in Flatworms
  - All flatworms rely on <u>diffusion</u> for <u>digestion</u>, <u>respiration</u> and <u>circulation</u>.
  - They <u>don't have</u> complicated organ systems, because they are flat!

## DIGESTIVE SYSTEM

- Digestive Structures of a Flatworm
- The digestive cavity is branched throughout the body and opens to the outside through the pharynx, <u>one way</u> <u>in, one way out</u>
- Why?
  - How does an animal get <u>nutrients</u> around their body <u>without</u> a vascular system
    - Diffusion!

## NERVOUS SYSTEM

- The nervous system (in dark gray) consists of ganglia and two nerve cords that run the length of the body.
  - Ganglia: senses <u>light</u>, <u>chemicals</u>, and <u>pressure</u>
- <u>Some</u> flatworms have <u>eye</u> <u>spots</u>

## SEXUAL REPRODUCTION

- The reproductive system (in green) has <u>testes</u> and <u>ovaries</u>, or <u>male</u> and <u>female reproductive</u> <u>organs</u>, along both sides of the body.
- Flatworms are <u>hermaphroditic</u>
  - How does it work?

https://www.youtube.com/watch?v =wn3xlulRh1Y

### WHAT HAPPENS AFTER PENIS FENCING?

- <u>Both</u> worms <u>want</u> to be the <u>male</u>
- Sperm is <u>absorbed</u> through the <u>ectoderm</u> to fertilize the <u>egg</u>
- The loser bares the burden of motherhood
  - This worm will have to work harder to find food and resources while pregnant
- After giving birth, the <u>worm</u> will fight <u>again</u> to be the <u>male</u>

## ASEXUAL REPRODUCTION

- Asexual Reproduction
- By fission
- Animal <u>splits</u> in <u>half</u>

### WHAT DO PLATYHELMINTHES LACK?

- They <u>do not</u> have a "<u>body cavity</u>"
- They <u>do not</u> have a <u>respiratory</u> or <u>circulatory</u> system

# GROUPS OF FLATWORMS

- Turbellarians
- Turbellarians are <u>free-living</u> flatworms. <u>Most</u> live in <u>marine</u> or <u>fresh</u> <u>water</u>.
- Most species <u>live</u> in the <u>sand</u> or <u>mud</u> under <u>stones</u> and <u>shells</u>.

## TURBELLARIA

#### Movement

#### Free-living flatworms move in two ways.

- <u>Cilia</u> on their epidermal cells help them glide through the water and over the bottom of a stream or pond.
- <u>Muscle cells</u> controlled by the nervous system allow them to twist and turn.

### PARASITE

 An <u>organism</u> that <u>lives in</u> or <u>on another</u> organism (its host) and <u>benefits</u> by deriving nutrients at the <u>host's</u> <u>expense</u>.

## PARASITES

- <u>Most parasitic worms</u> do <u>not</u> need a <u>complex</u> <u>digestive system</u>.
- They <u>obtain nutrients</u> from foods that have <u>already</u>
  <u>been digested</u> by their <u>host</u>

## **GROUPS OF FLATWORMS**

#### Trematoda

- Flukes are parasitic flatworms. Most flukes infect the internal organs of their host.
- They have <u>suckers</u> that help attach themselves to their host
   (oral and ventral suckers)

### LIFE CYCLE OF A BLOOD FLUKE

#### Life Cycle of a Blood Fluke

- 1) Eggs pass out of human host in feces
- If the eggs reach the water, hatch into free swimming miracidia (24 hours to find host)
- 3) The larva (miracidia) find snail, burrow inside it and digest tissues
- 4) Fluke reproduces asexually in snail, and break out of snail
- 5) The free swimming larva have 48 to find human
- 6) Larva penetrate any exposed skin of human
- 7) Reach vein, travel to heart and lung, then eventually to liver. Here they change to adult. After 3 weeks in liver, they lay eggs in veins around large intestine

### ZOMBIE SNAIL

- Leucochloridium paradoxum
- <u>http://www.youtube.com/watch?v=EWB\_COSUXM</u>
  <u>w</u>

### FORM AND FUNCTION IN FLATWORMS

#### Cestoda

- <u>Tapeworms</u> are <u>long</u>, <u>flat</u>, <u>parasitic</u> <u>worms</u> that are adapted to life inside the <u>intestines</u> of their hosts.
- Attach themselves to host by <u>disks</u> that <u>bear</u> <u>hooks</u>

## CESTODA

#### Structures of a Tapeworm

Scolex: The tapeworms "head" Has hooks and suckers to hold onto host
